Test Coverage Summary

- Total test cases: 10
- P0: 2
- P1: 5
- P2: 3
- Positive functional scenarios: 9

- **Negative functional scenario:** 1 — valid product type with no matching catalog products
- **Search coverage:** Product-type search, multi-word product search, no-match behavior
- **Filter coverage:** Price, brand, multiple filters
- **Sort coverage:** Price ascending and descending
- **Combined behavior:** Search + filter + sort
- **Invalid/empty input scenarios:** None

Persona Review – Team Lead

Review Summary

The test suite provides functional coverage of the core product discovery flow, including product-type search, filter behavior, sorting, and combined search/filter/sort operations. Priority distribution appropriately identifies core search scenarios as higher priority while assigning lower priority to combination and secondary sorting coverage.

Team Lead Comments

1. **TC001 and TC002 – P0:** Appropriate prioritization because successful product-type search is a fundamental e-commerce capability.
 2. **TC003:** Good coverage of multi-word product-type searches; retain this scenario to verify realistic customer search behavior.
 3. **TC004:** Valid negative functional coverage. It uses a valid product type with no matching catalog data rather than an empty or malformed input.
 4. **TC005–TC007:** Filter coverage is adequate. The combined-filter scenario is particularly useful for validating that filters work together rather than independently.
 5. **TC008–TC009:** Both primary price-sorting directions are covered and should verify the complete ordering behavior.
 6. **TC010:** Good end-to-end functional combination of search, filtering, and sorting.
 7. **Expected vs. Actual Result:** Actual Result should be populated during execution with the observed application behavior; it should not be copied from Expected Result.
 8. **Recommendation:** During execution, capture evidence for failures and verify that the displayed product attributes, prices, brands, and ordering correspond exactly to the applied criteria.
 9. **Scope:** The suite intentionally excludes empty, invalid, and malformed input scenarios as specified.
 10. **Overall review:** The suite is suitable as a functional regression baseline for the specified Product Type Search and filter/sort behavior.
-

Scenario 3— Shopping Cart

✗ Weak: "Test the cart functionality."

Review Summary

The suite covers the defined scope (add, remove, update, price calculation, coupon scenarios) across positive and negative paths with a reasonable P0/P1/P2 distribution. Coverage of cart persistence, maximum quantity limits, multiple-coupon stacking, and discount removal is absent. TC003 and TC007 lack explicit boundary values. Actual Result column is unpopulated, as expected pre-execution.

Team Lead Comments

1. **TC002** — Merge intent with TC001 is acceptable, but specify whether the badge counts units or line items; ambiguity will cause inconsistent execution.
2. **TC006** — Add a boundary case for maximum allowed quantity; current suite tests only the happy path.
3. **TC007** — Acceptable as a negative test, but split "-1" and "abc" into separate executions to isolate validation logic.
4. **TC009** — Define discount rounding behavior (e.g., ₹2,500 × 10% = ₹2,250); unspecified rounding is a common defect source.
5. **TC010** — Expand to cover coupon removal and re-application; these are high-risk regression areas.
6. **Missing coverage** — Cart persistence across sessions, and price recalculation after coupon removal. Recommend adding in the next cycle.
7. **Overall** — Suite is fit for execution after addressing comments 2, 4, and 5.

Approve with minor revisions.

Scenario 7 — Dashboard / Report Generation

google.com/search?q=Dashboard+%2F+Report+Generation&sca_esv=8f55d1c39308862b&sxsrf=APpeQntNtsRylln3HFdE7dbbdL_77le7XA%3A1789655676212&sourc...

Dashboard / Report Generation

Dashboard reporting and report generation translate raw, fragmented data into dynamic visual interfaces that allow organizations to track Key Performance Indicators (KPIs), monitor daily operations, and make real-time, data-driven decisions. Rather than scrolling through massive spreadsheets, dashboards consolidate critical charts, KPI tiles, and tables onto a single screen for quick interpretation. Display +3

Here is a breakdown of how modern dashboards function, the core types used by businesses, and the primary tools available to generate them.

Core Varieties of Dashboards

Businesses deploy four distinct types of dashboards depending on the user's role and the analysis required: Olik
